

Skylight dim to warm

The Skylight is equipped with the dim to warm function. This means that the color temperature is related to the brightness of the luminaire. Reducing the brightness, automatically the color temperature gets warmer. It is possible to control the luminaire brightness through a touch dim switch, adjusting in the same time brightness and CCT.

Dim level	Lumen [lm]	CCT [K]
50%	3500	3800
57%	4000	4000
75%	5100	4300
100%	6600	4900

Touch and Dim behaviour

When the light is turned on via the push button (short push), the driver will recall the last dim level.

If the button is pushed for a longer period of time, the light will dim up and down, depending on what is opposite from last dimming direction.
